

# SRX

## General Description

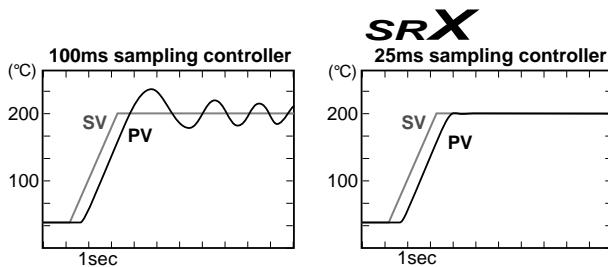

The SRX is a module type digital controller with a super high speed sampling of control updating cycle time of 25ms (0.025 sec). Dual loop control can be performed with a single compact module. A maximum of 31 modules can be connected for 62-loop control. Communication and power supply for extension modules are snapped together via mating connectors. Distributed installation via RS-485 is possible to allow formation of a multi-zone distributed control system in a compact size.

## Features

- ☆ High-speed feedback control
- ☆ Multi-zone space-saving
- ☆ 256 Ramp/Soak program function

### High-speed Feedback Control

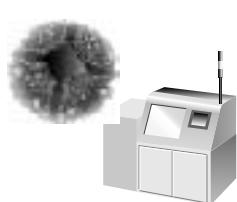

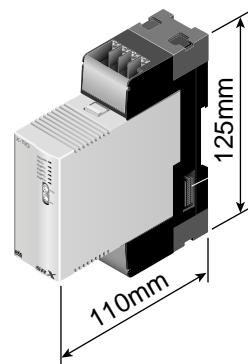

The SRX sampling of the control updating cycle time is a rapid 25ms (0.025sec.) Supplied with high resolution input and parameters settable in 1/100 sec. for process applications with fast response. Applications in RTP (Rapid Thermal Process), RTA (Rapid Thermal Anneal) and pulse heat temperature control of flip chip bonders in semiconductor manufacturing can be controlled by the SRX. The high speed sampling function also makes it suitable for additional application requirements such as pressure and flow rate.

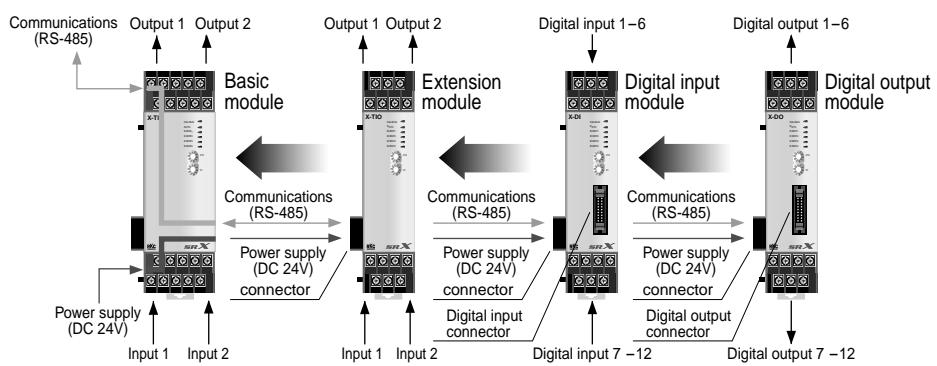

### Multi-Zone Space-Saving

Dual loop control can be performed with a single compact module. Side connectivity for power supply and communications eliminates the need for wiring and offers close mounting. Distributed installation via RS-485 is possible to form a multi-zone distributed control system in a compact size.

The digital input module is used to accomplish operation mode changes. Digital output module outputs operating state or various event conditions.

Pulse heat temperature control of flip chip bonding.

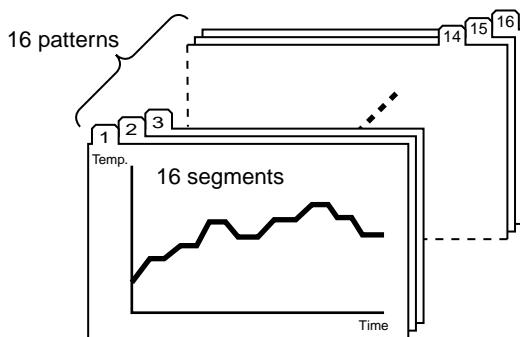

Extension modules can be added to a basic module.
